

Kali on a mac

For M1/M2/M3/M4 using a VM

Step 1

- Download and install UTM virtual machine:
<https://mac.getutm.app/>

Step 2

- Download Kali Linux for Apple Silicon (ARM64):
<https://www.kali.org/get-kali/#kali-installer-images>

Step 3

- Create new VM in UTM
 - Open UTM
 - Click "Create a New Virtual Machine"
 - Select "Virtualize"
 - Select "Linux"
 - Click on "Browse" (under boot ISO image)
 - Select the Kali ARM64 ISO that you downloaded
 - Hardware you can allocate based on the memory and CPU available on your mac os, recommended:
 - Memory: 4–8 GB
 - Cores: 4 (8?)
 - Storage: (30 GB minimum)
 - Select where you want your shared directory
 - Optional: change name to "Kali Linux"

You have now created your virtual machine and a new window will open

- Go to settings by right clicking and then click "Edit"
 - Change Emulated Display Card to "virtio-ramfb" (?)
- If you get a black screen when trying to start:
 - Click "+New..."
 - Choose "Serial"
 - Start up the vm and install kali using the terminal

Step 4

- Install Kali normally
 - When everything is done shut down the vm and close the windows
 - On CD/DVD, choose "clear" to clear the ISO image
 - Start again
 - You are now ready to use Kali
 - Don't forget to run `sudo apt get update` and `upgrade`

For Intel Macs using a VM

VM options:

- VMware Fusion
- VirtualBox
- UTM

Problem: No wifi? Must use a USB wifi adapter?
